# High pKa variability of cysteine residues in structural databases and the effect of H-bond contributions

[Yapısal veritabanlarındaki sistein kalıntılarında pKa değerinin yüksek oranda değişkenlik göstermesi ve H-bağı katkılarının etkisi]

Stefano M. Marino, İnanç Soylu

Akdeniz University, Department of Agricultural Biotechnology, Antalya

**Table.** Comparison of different propka implementations (all residues), results with three replicas (random 1,000 points sampling)

	ppka3 [pKa] <sup>#</sup>	ppka3 SD	ppka1 [pKa]	ppka1 SD	ΔpKa (ppka3 – ppka1)	p-value (t-test, n=1000**)

#legend: [pKa]=average pKa for each type, SD=Standard deviation; ΔpKa (ppka3 – ppka1) = ppka3 [pKa] - ppka1 [pKa]; t-test described in Methods. \*\* Each line reports statistics (t-test derived p-values, last column, as in Table 1, main text) obtained by randomly selecting 1,000 points (out of the full dataset of 750 proteins, 40605 residues); random selections were repeated three times for each residue (hence, three rows per residue are reported in this table), reflecting three independent replicas of the calculations reported in Table 1 (to which Table S3 should be compared for validation purposes; see main text).
